

Kyounuk (Karl) Kim

Forward Deployed Engineer portfolio

Seoul, South Korea · Founder and enterprise AI delivery leader

This portfolio uses substantiated project, repository, merged PR, and internal product records. Confidential names, credentials, personal data, and private source code are omitted.

VESSL AI FDE alignment

Requirement	Evidence	Boundary
Customer-facing technical practice	15+ years in software, solution architecture, BA/SA, PM/PL, consulting, and delivery.	No unverified contract or win claims.
Solution design and explanation	LG D2C service planning; enterprise AI/RPA/platform delivery; NexAI architecture.	Customer names generalized where needed.
AI workload understanding	On-device Korean NER, multi-channel parsing, safety signals; 5ETS consensus workflow.	Government proposal submitted, not selected.
PoC/migration/problem solving	Enterprise rollout governance and operational runbooks; Multica validator/worker workflows.	Direct GPU migration leadership is not claimed.
Python/log diagnosis	Public Multica source and merged implementation PRs; prior development experience.	Recent public GPU/Python evidence is limited.

Selected projects

1. Multica — multi-agent orchestration

Designed and operated workflow patterns for agent routing, validator gates, worker dispatch, waiting ownership, and auditable handoffs. Public evidence: github.com/karlkim1004/multica; merged validator CLI PR #75; merged worker-pool PR #55.

2. AIDO — on-device AI architecture

Founder and AI product architect for Korean NER, multi-channel parsing, behavior-pattern safety signals, staged notifications, and caregiver workflows. Implementation and release records are private. The related government R&D; application was submitted and not selected; patent items are applications, not grants.

3. 5ETS — AI consensus and operations automation

Defined a multi-expert evidence workflow, structured consensus, scheduled execution, health/usage observation, and failure handling. Source and operational records are private; no performance or financial-return claim is made.

Fit and boundaries

Strong: customer-facing technical delivery, solution framing, enterprise rollout coordination, AI workflow architecture, stakeholder communication, and operational verification.

Gap: direct GPU-cluster PoC/migration leadership and recent public Python/GPU implementation evidence. Neither is overstated.

No secrets, credentials, personal data, customer-confidential material, unsupported metrics, government-award claim, granted-patent claim, or completed-PoC claim is included.
